```

요약하자면

인풋 뒤집어서 함수1에 넣어준다. 함수 1 은

입력된 값을 배열로 만들어서 code1[이번달+i]의 배열과array[i]배열을 xor연산한다 그리고 뒤에 ""를 하고 붙인다 그리고 그 string을 반환한다. 그텍스트를 다시 배열에 넣고 그 배열의[i]와 i를 이용해서 함수2를 호출 배열[i]를 int형으로 바꿔서 num에 넣고 i를 3으로 나머지해서 num2에 넣

```
고 num3에는 2가 들어간다 그러므로 num2의 값에따라서
0과 1과 2로 나뉘는데
0이면 num1의 값 + 날짜 * 2+ 분 * 2 + -시간 *2
1이면 num1 + 달 * 3 + 분 * 2 - 달
2면 num1 + DayofYear - 달 * 10 - 분 * 2 - 시간* 8 -4
를 리턴
하는 형식으로 프로그램이 흐른다 그럼 이제 이것을 반대로 보내면 플래그값이 나온다
여기서 날짜에 해당하는것들은 Sweet Secret Memo _ logger 0.1
Date: 10.26_23:44 [UTC + 09:00]
이런식으로 저장이 되어있으므로 이것들을 이용해서 복호화하는 코드를 짜면
